Expanded Cinema

I used AI generated images to create my expanded Cinema as an informative piece. The information I researched was the brain being the body's first translating organ and the digestive system being the second. The images project a world where people can travel inside the body and explore the many organs that make up human biology. This gives insight into the importance of each organ and how they all make up the incredible functions to keep the human alive.
Although it is common knowledge that the brain in our heads gives our bodies the signals on what to do, some may argue that the digestive system is the first brain that sends signals to the rest of your body to fix things. There are times when I get feelings and signals in my stomach area before my brain feels anything. This is when I know to take a deep breath, internalize what I'm feeling and what's going on by thinking it through. In these cases, yes the digestive system is telling me something first.

My AI slideshow represents the many functions of the body and helps educate us. My piece is funny, colorful and filled with facts! It allows viewers to imagine the basics like a child floating through the human body. Storyboard is based off both the brain and digestive system coming together and realizing that they both need each other to live. When they both work together, the body does a lot better breaking down waste and getting rid of it. Also, helping to cleanse and nurture the body, starting mainly with the gut. After- all this is where most problems occur. Now wonder why it is such a smart area with tremendous duty.
